

Two lines of evidence, four conclusions (GSM8K against GSM1k)

accuracy gap on the matched twin

	absent	present
depth contrast significant	Seen, not exploited Items are stored but not used. Memorisation without exploitation.	Contamination confirmed The straightforward reading. Report the exposure interval and the adjusted score.
depth contrast null	No evidence At this sensitivity. Report the detection floor so the null reads at the right strength.	Inflation, not memory Exposure below the detection floor, or format overfitting, or difficulty mismatch.

Behavioural evidence alone cannot separate the right-hand column. That is what the representational test adds.
